Salt Reagent & Saltesmo

- Reagent to determine the presence of salt water in lubricants and fuels

Salt Reagent & Saltesmo

Water contamination in lubricating and/or fuel oils is a bad situation for the operator as water is the biggest enemy in lubricating and fuel oils. To know the nature of the water can help to identify the source of contamination.

This will help to fix the problem faster and to minimize time to trace the leakage/contamination point.

Salt presence is an indication for sea water. Fresh water is an indication for cooling (oil cooler) or boiler water (steam heating).

This test is easy to handle and gives in a short time a reliable statement about the nature of water contamination.
